

The Restaurants and The Food Business — eDataPay

About Us

eDataPay — The Restaurants and The Food Business

We simplify restaurant payments, online ordering and bookkeeping so owners stop fighting reconciliation and start growing revenue.

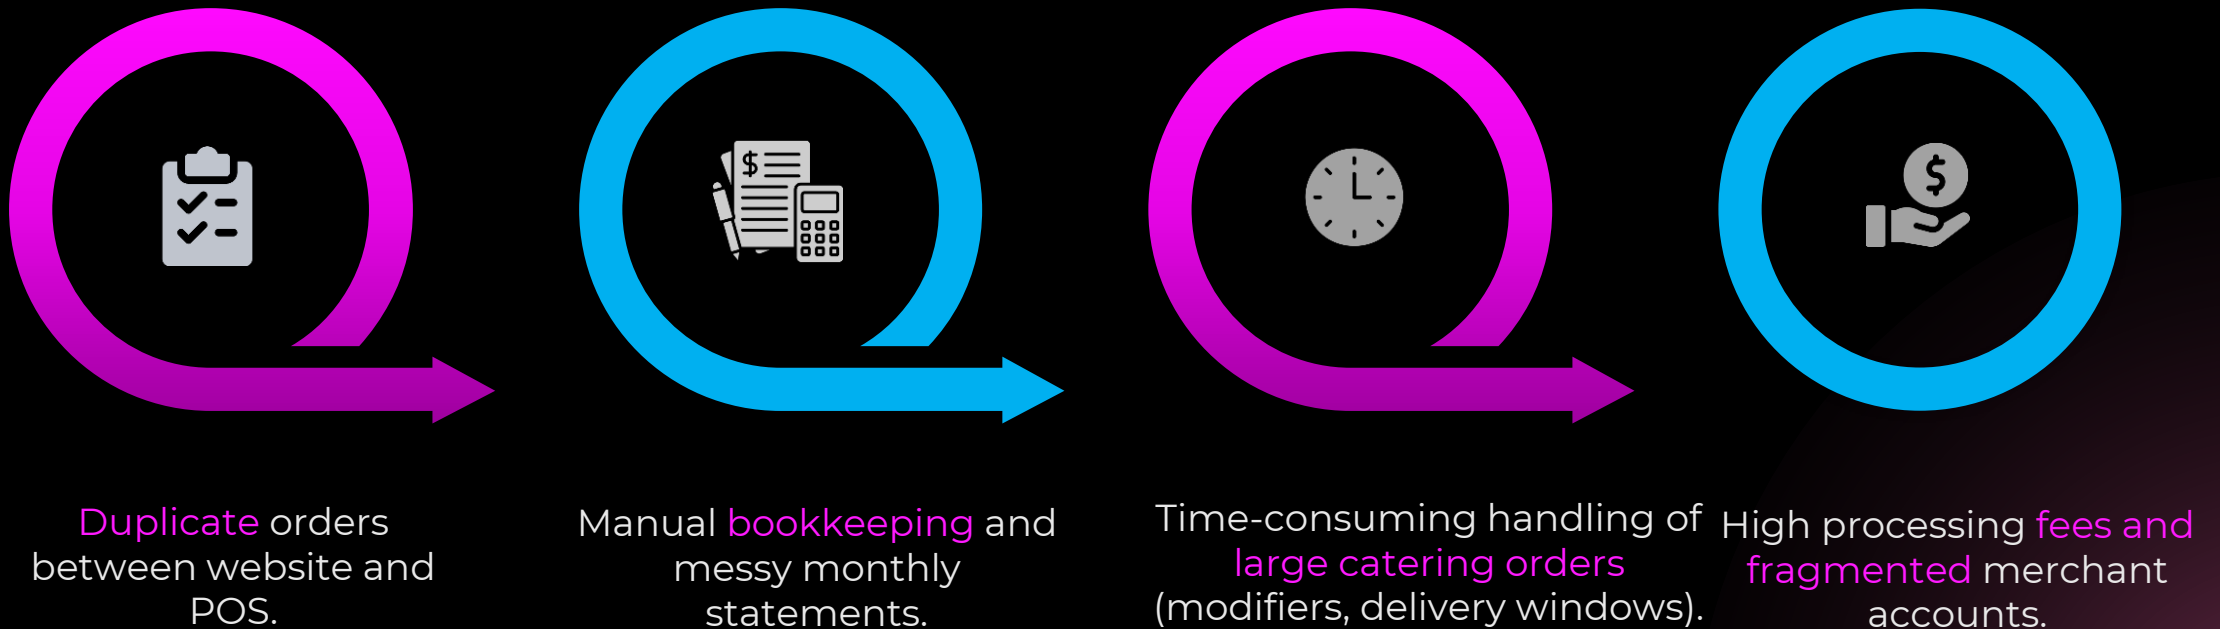

We provide payment processing (MID provisioning), POS integrations (Talech, Clover, Toast), and QuickBooks automation — all delivered with white-glove onboarding and a low-risk pilot.

Keep orders, payments and accounting in sync — save thousands annually on fees and labor.

Goals & Pain Points

Goals: Better pricing, direct bank relationships (single MID), same-day payments where available, and a simple UX for staff.

Why it matters: Consolidation with QuickBooks reduces errors, lowers fees, and frees management time — measurable savings that often reach thousands per year for multi-site caterers.

Talech Restaurant POS & recommended option for catering Business and websites

Talech — bank-backed simplicity, tailored for SMB restaurants

- **Key benefits:** Strong QuickBooks syncing, easy iPad deployment, U.S. Bank / Elavon MID option, built-in online ordering partners, straightforward pricing.
- **Catering features we'll validate in demo:** large-order modifiers, scheduling windows, kitchen routing & printed tickets.
- **What we (reseller) will show:** live order from website → Talech → QuickBooks journal; proof of same-day funding if MID supports it.

“We'll show you your savings in writing — email a statement, get a free audit.”

Accounting & Ordering (QuickBooks + Online/Offline options)

How we automate statements and stop double-entry

QuickBooks Integration

Options: direct connector (Talech → QBO), middleware (Amaka / custom CSV), or managed daily journal uploads. We will present a sample journal mapped to your Chart of Accounts during the demo.

Online + Offline ordering: web cart tokenization (MID) so web and in-store payments settle to the same account; webhook/API or middleware routes orders into the POS; offline-capable POS behavior ensures orders are not lost during connectivity issues.

Ordering apps & ecosystem:

support for common ordering platforms (WooCommerce, Toast Stream, third-party aggregators) — we include reconciliation for delivery fees, tips, taxes and processor fees.

Proof point: show a sample CSV/journal and reconciliation checklist during the pilot so the bookkeeper can sign off.

Clover POS

Restaurant, APPs, Pay at the table and order at the table...

Strengths: Lower monthly cost, flexible hardware bundles, app marketplace for online ordering and kitchen workflows, easy merchant bundling.

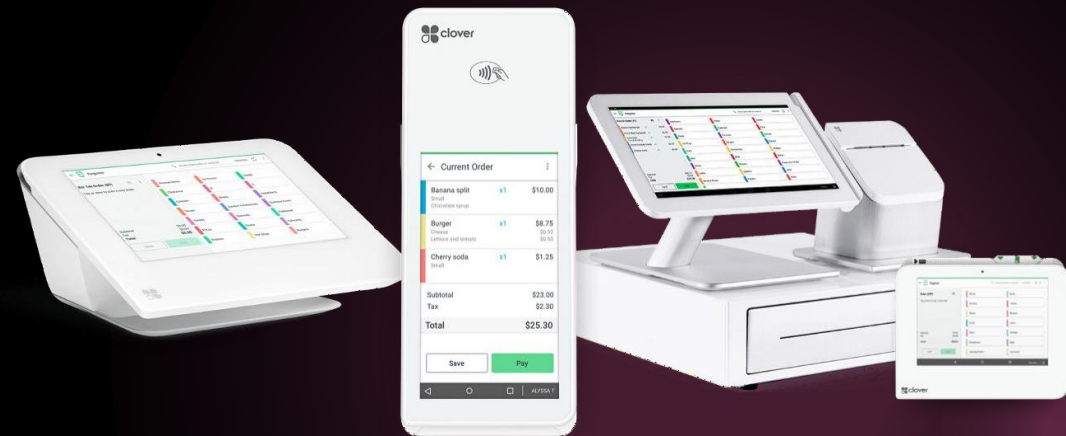

Limitations: Some advanced restaurant/catering features require third-party apps (we bundle and manage them to reduce friction).

Sales angle: since more SaaS companies are a PayFac and not direct to banks you can definitely get the best pricing including rewards, Gift cards, APP Stores, and online orders and more , with beautiful modern white look hardware, app fees, merchant processing — demonstrate how switching can save thousands annually at the restaurant and across locations.

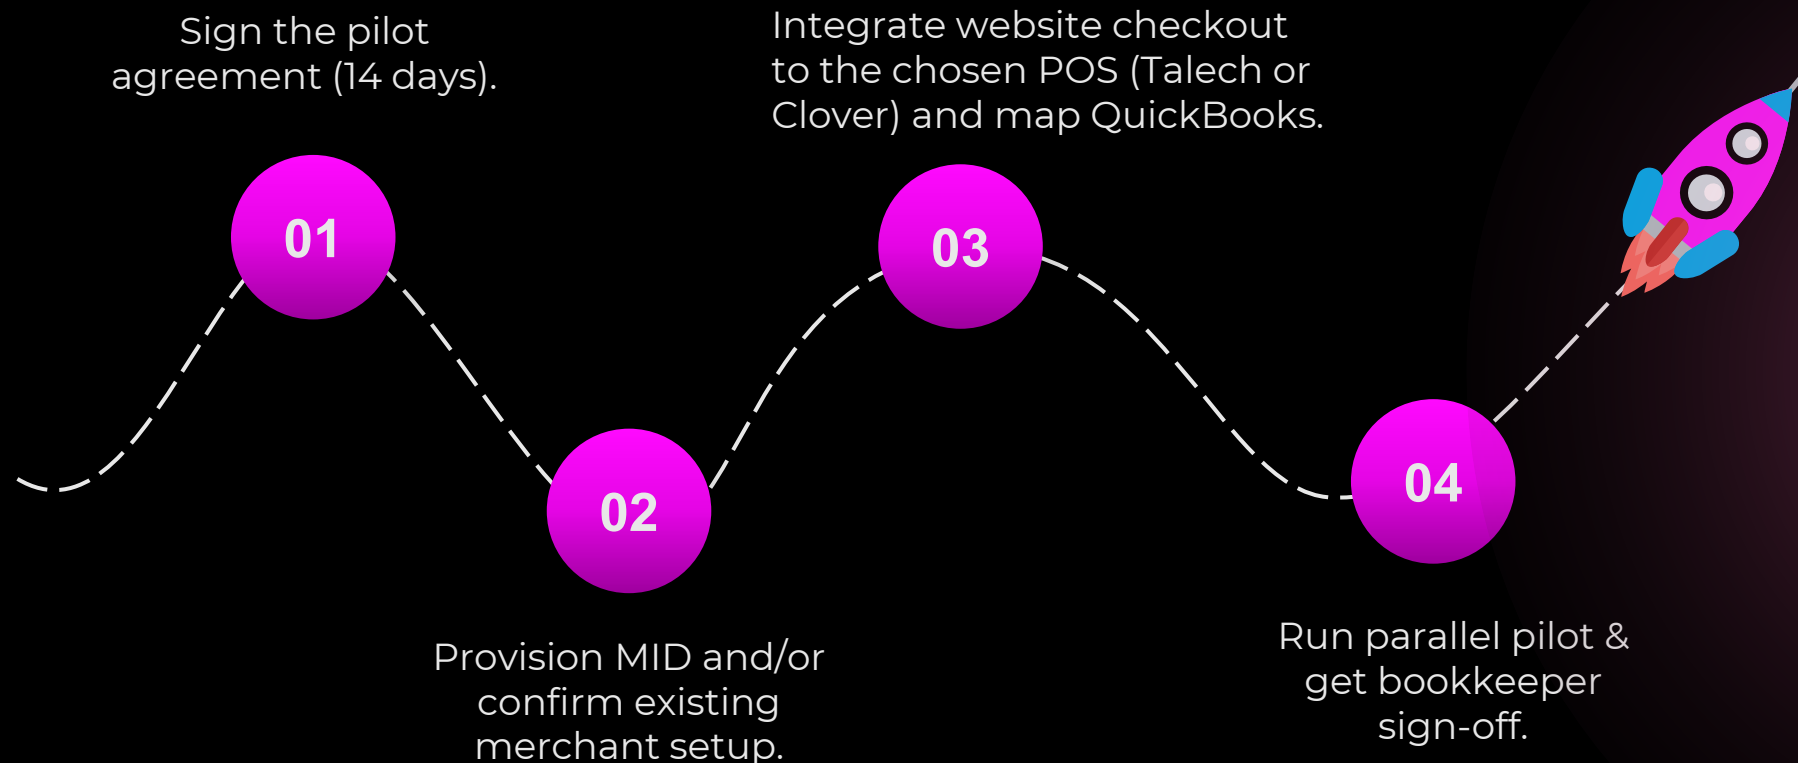

Pilot offer: 7–14 day Clover pilot with app bundle, web integration, and QuickBooks connector validated by your bookkeeper.
